

- High quality of the filtered product
- Guaranteed filtered product organoleptic stability - Lowest as possible DO pick up
- Minimum OPEX and cleaning costs – Waste-free production
- Low environmental impact and energy savings
- Improvement of workplace and operator safety
- Automation of the filter process – No supervision is required
- Easy to use
- Possible to run the filter remotely

↑ Ceramic membranes

← Very Low DO pick up

CFK-B Models from 20 m² to 680 m² of filtering surface area
Modular systems of larger size available on request

CFK-B crossflow filters with ceramic membranes for beer

Experience in ceramic membrane crossflow filtration has led Della Toffola to the development of its new CFK-B series filters designed to filter beer for small, mid-sized and big breweries.

Della Toffola CFK-B filters are suited for use with all types of beer, even those with special characteristics and hard to filter. Excellent organoleptic stability and exceptional high clarity of the filtered product are ensured.

CFK-B crossflow filters enable the optimization of every filtration cycle, production with minimal loss, the lowest

operating expenses, minimal environmental impact, waste-free and reduced water and power consumption. Just one filtration cycle is enough to pass from the fermentation tank to bottling for remarkable savings in time that boost brewery output.

All filters are fully automatic and come with touchscreen and user-friendly software. They require no supervision during operation.

Della Toffola CFK-B crossflow filters, a choice that makes the difference.
